256 CHATBOT

About

This is a very rudimentary chatbot built in Python. It's built for single sentence inputs & uses a very basic implementation of text classification. The more data it has, the more accurate it'll be.

How it works

Now you may be wondering, "how is it getting the data?" and that's quite simple as well. By default, it looks for data in the `. /intents` folder. It will look through any json file to check if there's data that it can use there.

Example

```
Ask the bot something (or enter "quit" to quit): Hey!
Hi! How are you doing?
Ask the bot something (or enter "quit" to quit): Tell me a joke
Why don't koalas count as bears? .... They don't have the right koalafications.
Ask the bot something (or enter "quit" to quit): What's the weather like in New York?
Unfortunately, I cannot tell you what the weather is in New York yet... sorry about that!
Ask the bot something (or enter "quit" to quit): quit
Program exited.
```
